

CMS Prototype Working Session

Meeting Notes & Next Steps

Date: May 2026 (exact date omitted from transcript)
Attendees: Jerel (PM), Ariel (B2B Business Lead), Brendan (Backend PM), others
Session Type: Prototype Review / Architecture Working Session
Distribution: Internal — B2B Hub Team

Core Insight: Contract-Led → Segment-Led Pivot

KEY ARCHITECTURAL DECISION

The CMS admin experience must be reorganized from **contract-first** to **segment-first**. Ariel's mental model — and the customer-facing experience — is segment-led. Managing a segment-level experience from inside a contract entity creates unnecessary friction and will hinder operator adoption.

Current State (Problem)

The CMS admin is organized by contract first. To manage which contract appears for a given segment and state, the admin must navigate into the contract entity and configure segment/state mappings from inside it. This is counterintuitive for operators whose reference point is always the segment.

Agreed Direction

The CMS should present a **segment-led administrative interface**. The admin navigates to a segment (e.g., Higher Ed, K-12), and from that context manages:

- Which contracts are associated with that segment
- State-specific portal ID overrides (e.g., Utah Higher Ed → E&I; portal 952 instead of the national default)
- Featured contract designation and display order
- Estimated Annual Purchase Volume ranges (per segment)

The underlying data matrix (segment × state × contract → portal ID) does not change — only the admin entry point does. Contract-level management is retained for contract-specific content: logos, contract numbers, custom copy, and additional links. Both views can coexist; the segment view is the primary operational interface.

Key Discussion Points

Routing Matrix Complexity — E&I; Example

E&I; was used to illustrate the core problem. E&I; has a national default, but Utah Higher Ed routes to portal 952 and Virginia has its own mapping. Those overrides currently live inside the E&I; contract entity. Ariel's expected entry point is: 'I'm in Higher Ed — what shows up for Utah?' not 'I'm in E&I; — what are my state overrides?' The segment page should be where that question is answered and managed.

BuyBoard as the Clean Example

BuyBoard is currently set to all states. If the business wanted to restrict it to California K-12 only, that constraint should be set at the segment/state level — not buried inside the BuyBoard contract entity. This clearly illustrates why segment-first management is the right default orientation.

Contract Logo Gap Identified

Ariel flagged that individual contract logos are missing from the prototype listing view. Each contract entity needs an uploadable logo field. If no logo is uploaded, the UI should fall back to a generic placeholder. The logo_url field exists in the data model but is not yet surfaced in the CMS admin UI.

Subcontract / Child Contract Management

Some contracts have state-specific sub-pages (e.g., State of Utah) with custom contract numbers, hyperlinks, contact information, and additional links below the logo. This content currently lives in BDBTools. The discussion leaned toward migrating these parameters into the CMS to avoid split management, but this was flagged as a decision to revisit — not finalized this session.

Core Pages Section Missing from CMS

The CMS currently lacks admin panels for core non-segment pages: Contracts, eProcurement, Studio, B2B IT Services, and Contact Us. These were in an earlier version and need to be restored.

Annual Purchase Volume — Segment-Specific Ranges

The sign-up form's Purchase Volume field needs to dynamically reflect ranges appropriate to the selected segment. Each segment's CMS page should include a slot to configure those ranges. The INITIAL_CONFIG structure partially supports this; the wiring between segment selection and displayed ranges needs to be completed.

Prototype Disconnect: Segment Homepage Sections

Jay's redesign embedded segment sections directly into the homepage rather than as standalone pages. The CMS data binding was never updated to reflect this change — it's still wired to the old standalone segment pages. This is a known bug that must be fixed before Thursday's session.

Decisions Made

Decision	Detail
Segment-led CMS admin	Confirmed. Segment page is the primary entry point for contract and state management.
Contract view retained	For logo upload and contract-specific content fields only.
State exclusivity managed at segment level	e.g., BuyBoard California K-12 only — configured from the segment page, not the contract.

Single admin interface preferred	Lean toward segment-only view to simplify operator training; contract view secondary.
Thursday session = UAT	Prototype treated as a dev-built working candidate. Session is acceptance testing against PMO 5000 real-world use cases.

Next Steps

Jerel — Before Thursday

■ Fix homepage/segment CMS disconnect

Rewire CMS segment data to the homepage-integrated sections. The current binding targets the old standalone segment pages that no longer exist in the Jay redesign.

■ Build segment-led CMS GUI

Each segment entry in the CMS should expose: featured contract, associated contracts list with drag-to-reorder, state-specific portal ID override rows (state + portal ID fields), and estimated annual purchase volume ranges.

■ Add contract logo upload field

Surface the logo_url field in the contract entity CMS admin. Implement generic fallback logic when no logo is uploaded.

■ Restore core pages section

Add CMS admin panels for: Contracts, eProcurement, Studio, B2B IT Services, Contact Us.

■ Wire Annual Purchase Volume per segment

Update INITIAL_CONFIG so each segment entry includes purchase volume ranges. Confirm sign-up form pulls dynamically based on selected segment.

■ Audit remaining sign-up CMS fields

Confirm current ~60% CMS coverage claim. Identify and wire all remaining sign-up fields into the CMS admin.

Ariel — Before Thursday

■ Pull 4–5 recent contract change tickets representing real-world admin scenarios.

■ Record short screen-capture walkthroughs showing the intended workflow for each use case.

■ Send videos to Jerel for calibration ahead of Thursday's session.

THURSDAY SESSION FORMAT

Treat the prototype as a dev-built working candidate submitted for acceptance. Run Ariel's real-world use cases against the CMS to confirm segment-led admin covers them end-to-end. Any gaps identified become the final round of prototype tweaks. Accepted prototype state drives requirements export.

Open Items / Parking Lot

■ State-to-contract-to-portal routing location (CMS vs. BDBTools)

Still an unresolved architecture decision. Not addressed this session. Must be resolved before engineering handoff.

■ Subcontract / child page parameter migration

Whether to pull BDBTools state-specific parameters (contract number, custom copy, additional links, contact info) into the CMS or continue managing in two places. Flagged but not decided.

■ PMO 5000 go-live dependency

One-to-one portal mapping remains the priority launch configuration. Manny Steigman approval gate is in place for all customer-facing changes. Manny expected back approximately May 2026.
