

Portal Routing Configuration

Segment × Contract × State Mapping · Change Process: DES or WebOps Jira · v1.0 · Jun 03, 2026

OVERVIEW

What is Portal Routing?

When a B2B customer signs up, the hub resolves which BDBTools portal to send them to based on three inputs: their **organization segment**, the **cooperative contract** they're accessing, and their **state**. Today this logic is hard-coded — any change requires a developer deployment (2–8 week lead time).

Resolution Priority (first match wins):

- 1 → Exact State + Exact Segment
- 2 → Exact State + Any Segment
- 3 → Any State + Exact Segment (national default)
- 4 → Global Fallback — required on every contract

What Changed from CMS Prototype

The CMS PortalMappingsEditor UI has been **removed from Phase 1 scope**. Portal routing is operational infrastructure — not content. Changes will be managed through:

- PATH A

Data Entry System (DES) — preferred for routine ops updates by authorized personnel
- PATH B

WebOps Jira Ticket — for changes requiring engineering, or when DES is unavailable

Rationale: High-impact misconfigurations can misdirect all customers on a contract. Change velocity is low but consequences are high — ticketed workflow provides the audit trail and approval gates that a CMS edit history cannot.

ROUTING RULE DATA MODEL

Field	Type	Description
contract_id	VARCHAR	Cooperative contract key (omnia, ei, tips, buyboard, equalis, mhec)
segment	VARCHAR	Segment key or "" (empty = any segment wildcard). All 12 segments supported.
state	CHAR(2)	Two-letter state code or "" (empty = all states / national).
portal_id	VARCHAR	BDBTools portal ID integer. Must be active in BDBTools at time of rule creation.
active	BOOL	Inactive rules are skipped during lookup. Use to disable without deleting.
effective_from/until	TIMESTAMP	UTC. Supports scheduled routing changes. effective_until=NULL means no expiry.
jira_ticket	VARCHAR	WebOps Jira ticket ID that authorized this change. Required for traceability.
created_by / updated_by	VARCHAR	Operator identity. Immutable audit log records every change.

DES Workflow (Path A)

Validation Rules

1. **Requestor** — Open routing module → select contract → add/update/deactivate rule

2. **DES** — Validate: portal exists in BDBTools, no duplicate at same priority, fallback intact
3. **DES Approver** — Four-eyes sign-off required for government / cooperative segments
4. **DES** — Commits change → writes audit log → triggers cache invalidation
5. **QA** — Requestor verifies routing via test utility in staging/prod

WebOps Jira Ticket (Path B)

- Required fields in ticket:
- Contract ID + Segment + State
 - Portal ID (new & previous)
 - Business justification
 - Ariel Goldman approval comment
 - Manny Steigman approval (gov/coop segments)
 - Staging verified (Y/N)
 - Rollback plan

Rule	Sev.	Description
V-01	BLOCK	portal_id must exist and be active in BDBTools
V-02	BLOCK	No two active rules may share same (contract, state, segment)
V-03	BLOCK	Every active contract must retain a global fallback rule
V-04	BLOCK	contract_id, segment, state must be recognized values
V-05	BLOCK	effective_until must be after effective_from if set
V-08	WARN	Four-eyes approval required for gov/cooperative segments
V-09	WARN	jira_ticket strongly recommended; warning if empty
V-10	WARN	Warn if deactivating last state-specific rule for a contract

ROLES & EXAMPLE

Roles & Permissions

Example Rules — Omnia Partners

Name	Role	Routing Access
Ariel Goldman	B2B Business Lead	View, Request, Approve tickets
Manny Steigman	Senior Stakeholder	Required approver — gov/coop changes
Mr. Smith	Senior PM	View, Request, own process
DES Operator	Ops Personnel	Create / Update / Deactivate rules
DES Approver	Designated approver	Four-eyes sign-off in DES
WebOps Engineer	WebOps team	Implement approved Jira tickets
Sam Herman	BDBTools Owner	Consulted for new portal IDs
Josh Bernstein	PM Support	View / Read-only

Portal IDs are illustrative. Actual values from BDBTools.

Contract	Segment	State	Portal	Priority
omnia	state-local	CA	901	P1 — exact state+seg
omnia	k12	CA	903	P1 — exact state+seg
omnia	state-local		910	P3 — national segment
omnia	k12		911	P3 — national segment
omnia	higher-ed		912	P3 — national segment
omnia			900	P4 — global fallback ✓

Open Questions

- Does DES have a routing module, or does one need to be built? (Owner: Brendan Bagley)
- Existing customers: apply new routing to new sign-ups only? (Needs formal decision)
- Designated DES Approver when Manny is unavailable?
- Staging environment available for post-change validation? (Owner: Shia Bernstein)
